

## Installation Procedure:

## IMPORTANT

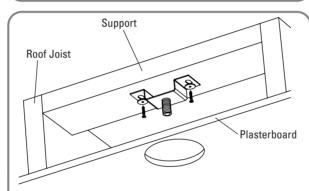

Wear suitable eye protection when drilling. Take care when using power tools near water - the use of a residual current device (RCD) is advised. Beware of hidden cables or pipes.

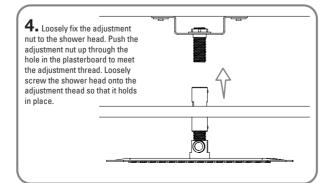

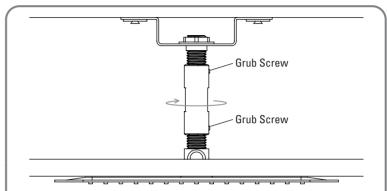

**2.** Fix the adjustment thread to the hole in the fixing bracket using the fixing nut and the fixing washer. Ensure the adjustment thread is secure and will not rotate in the fixing bracket.

**3.** Decide on the location for the shower head. Take into account any joists or trusses that might be above the ceiling.

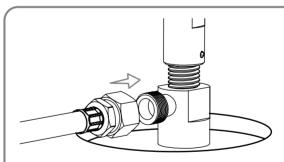

Cut a hole in the plasterboard in the desired location for the shower head. Above this location, ensure there is a secure support for the fixing bracket. Screw the fixing bracket to the support, making sure that it lines up with the hole in the ceiling.

**5.** With assistance if nescessary, tighten the shower head up to the plasterboard. Do this by rotating the adjustment screw. One person should hold the shower head in the desired orientation while the other person tightens the adjustment screw.

Once the shower head is tight to the plasterboard, tighten the 2 grub screws on the adjustment screw to secure in place.

**6.** Attach one end of the inlet hose supplied to the shower head. Attach the other end to the shower valve outlet. Check the whole system for any leaks.

## CLEANING

Whilst all these item have a high quality durable finish, they should nevertheless be treated with care.

Surfaces should be cleaned using only a soft damp cloth and clean water then dried using a soft cotton cloth.

Bath cleaning products, even non-scratch ones, could damage the finished surface.
